

Dave's Dobermans

I checked for Modernizr when initiating Canvas and provided a fall back, which I downloaded from a link from the modernizr github site. All pictures and videos are from my personal computer that I took of my dog. The data visualization was used in my pie chart on the home page in the top right of the site. My interactive map is displayed on the about page giving users a visual and tooltip as to where the business is located.

My interactive image gallery is on the dogs' page and uses the Mixitup plugin; I have also made each picture clickable which will lead the user to a larger image on a separate page. My video tag is used on the home page in my aside, I followed the fallback section covered in class, giving options on which form of the video browsers could download. I converted the movie on convert.com.

I used two HTML5 Canvas tags on the home page in my aside. I created them as if they were some advertisement for some pet products and a camera store (both fictional).

I used two jQuery effects, one in my gallery as a fade and rotate on the images themselves. I also created two buttons, one for lighter text and one for darker text just in case a users eyes couldn't read the text in the font color that was displayed.

I have always wanted to breed animals so that is what led me to choose a breeding site. Since I currently have a Doberman and he is very photogenic I decided to use him as a model for this site. I have also learned quite a bit about the breed in general so that also helped in my decision to go with a fictional breeding site.
